

The Removable Shelf with Dividers

I claim the as my invention the removable shelf with dividers. The removable plastic shelf is a solid piece of acrylic. It has round edges and measures 3.34x2x1. On one side of the shelf there are 18 open slots 12' long.

The dividers are solid pieces and made of acrylic. Both have different configurations. One divider measures 2x2.7x1 and has two open slots on one side top and bottom these open slots are 12' long. The other divider measures 2x1.5x1 and has only one open slot on top and also measures 12' long. With three removable shelves and four dividers assembled, a shelfless general purpose mailing container gains a substitute middle shelf. These substitutes plastic shelves saves the postal service from having to purchase another high cost metal build-in container.

Thank you
